

Cypherfunk

It's 2027 and a constellation of low cost open source servers reached a major amount of minorities and communities. While falling under standardisation as information and narrative are being manipulated by propaganda making use of information technology and AI content generation, some underground resistance grow increasingly strong world wide through glocal ecosystems and decentralised community.

They found this Github repository of open source code long ago but the ongoing genocides and tentatives of centralisation of power cut their internet access.

The never ending terror and chaos stimulated their critical thinking as true homo-sapiens are too soft to fall into a never ending cycle of violence; and like engineers they find solution to problems although they don't need to apply the development guidelines probably because of their atypical minds and they abstract way of thinking.

While super power are focusing in immortality and gene manipulation to enhance intelligence those decentralised arbor people born from the chaotic randomness and colonialism and slavery. Those conditions were so hard that only the strongest ones survived undergoing a natural selection.

Years later after France bombed it's own clients Libya, some proud parents are sending their kids on the most hellish journey ever crossing entire desert and seas across Africa, getting trade, raped, killed for their organs while the majority of them would sink in the sea, shot by French and Italian warships disguised as the united nations so each government could blame the other without shocking the public opinion.

Only the most beautiful and fit to adapt survived; about one on a hundred of kids that left their parents place survived and we lost track of the others as the radioactive isotopes France was putting into their food supply degrade.

Dealing with right racist foreign governments their abilities can only grow stronger in a form of resilience that every single european lost bought by comfort. They genetic diversity protects them from diseases and their suffering fueled empathy beyond the hypocrisis of the white colonialists so they will never let anyone experience what they have been through in a form of superior humility that no western lab can recreate in a synthetic manner (at least not without the risk of realising hundreds of deadly virus).

They managed to build a Software Define Radio from the rest of missile that didn't blow. They hack a few low orbits satellites. They finally have access to

internet and have enough experience in dealing with chaos to use it's code and start a community driven project that they even monetised in a legit and ethical manner and they can buy their first open source server.

They can host entire applications for free while owning their data, run artificial intelligence programs and they spent years of contributing to open source. Their abstract way of thinking helped the development of AI in the worst technical challenge as super powers targeted any devices as a source of information for training their new gods of large model language stealing their ideas, datas and leveraging insane amount of money.

Instead of trying to gain supremacy with giant AI models, they focus on dedicated modular applications echoing the idea of decentralisation and blockchain.

Some artists in western countries raise the alarm as governments collapse. Amongst them a few generative artists with background in applied sciences created beautiful visuals and patterns with complexe algorithms and when the last one died, AI replaced everyone in those fields and erase every records.

They had no idea that in the archive of the code they found on github remained some code based artworks and only them could read their code. When they found it they knew that at a moment in time they would be forced to turn vector fields algorithms into ballistic maps and to use the quantum number generator that was implemented to destroy every single encryption systems around the world.

Their experience of terror protects them from misusing those technologies regardless they scarcity they experiencing. From a distant place a command is sent and every single low costs servers start to exchange informations forming a pool of hundred thousands of computer sharing ressources like a giant raspberry tree.

All free open source decentralised community are linked and the combine compute power is about 0.2% of the super clusters from the imperialist super powers...

A vote is casted using smart contract, 10 day later all satellites crash on earth destroying strategic sites, killing millions of collabos and creating an unprecedented power outage world wide.

A strong feeling of hope embodies everyone as people could look at the sky and see the stars for the first time without being targeted by a satellites and labeled as activist.

But more over the milkyway never shined so bright reminding the worst tyrants how insignificant they are and they can only confort themselves thinking of the

sunset, set to be blood reddish as they now have an excuse to wipe the entire civilisation in their never ending quest for power while the rest of the world is wondering how many time the universe underwent this game; promising themselves that next time they'll found a way to track every single atoms in a last thought before a nuclear bomb reduce matter into elementary particles.

unkown tablet found in a teddy bear thrown to the sea written in an obscure programming language
