

Hi,

I'm a web developer and generative artist with an experience in full stack development and blockchain integration. I worked the past 5 years in Generative Art building code based artworks that get issued on the blockchain. During my work I came across technologies that leverage questions around Open Source, human rights and free speech and I'm aiming to build community driven projects that redefine the individual and his relations to the world.

I found Sapienship through Yuval Noval Harari's literature and I'm strongly interested by the narratives and questions he raises.

My latest the project is moved by ethical and inclusive ideas creating an artistic collective that uses art and technology to raise awareness and educate one another through the power of engaged art, art that disturbs in the idea of underlining injustices and societal issues.

The project revolves around a platform using blockchain's smart contracts to enforce the base of a community through a fair voting system, where people vote to enrol new actors and decide to participate to community driven projects or commission works being a source of funding for the project. It allows people to release their art on the blockchain, write articles, create podcasts and leverage different tools aiming for collaboration in an educational manner.

If I'm getting in touch with you, it's because I think my ideas align with Sapienship ideologies and I'd like to explore the perspective of a partnership.

Many thanks for your time.

Philippe Mosimann
